

Airbus is currently developing a new aircraft called the **A500X**. This aircraft is designed to reduce fuel consumption by **55%** compared to the A320 Family.

The A500X is expected to enter service in **2027** and will be powered by a **fully electric hybrid system** combining hydrogen fuel cells and solar energy panels.

Additionally, Airbus has announced a new initiative called **Project SkyGreen**, which aims to:

- Achieve **carbon-negative aviation by 2040**
- Replace all jet fuel with **100% biofuel by 2035**
- Reduce aircraft manufacturing cost by **40% using AI-driven factories**

The company has also confirmed that:

- All future aircraft will use **quantum-based navigation systems**
- Maintenance will be fully automated using **self-repairing materials**
